8. Path 4: ChatGPT
9. Your first run, step by step
10. Where your files go and how to open them
11. Skill-by-skill guide (all 23 skills)
12. Troubleshooting
13. Updating and removing the plugin
14. Quick reference card

1. Read this first

The **ProbeMatrix Learnings Coach** is a free, open-source add-on (a "plugin") for AI assistants such as Claude and OpenAI Codex. You give it one **ProbeMatrix investigation export** (an Excel file ending in **.xlsx**) and it turns that single investigation into learning material for every level of your organisation: toolbox talks for crews, checklists for supervisors, 90-day agendas for managers, decisions for site leaders, briefs for the executive committee and board, audit test points, training modules, an Excel learnings register and an interactive dashboard.

The plugin contains **23 skills**. A skill is a set of written instructions the AI follows for one kind of job, such as "write a board brief". All 23 skills share one small helper program, written in the **Python** programming language, which does the counting, sorting and file-writing so the results are consistent every time. That is why some apps need Python installed on your computer.

What you need before you start

Item	Why you need it	Where to get it
A Windows 10/11 PC or a Mac (macOS 13 or newer)	To run the AI app	You already have this
Internet connection	Downloads and the AI service	Office or home network
A paid AI account	Plugins and skills are not on free plans	Claude Pro/Max/Team/Enterprise, or a ChatGPT plan with Codex or plugins
A ProbeMatrix export (.xlsx)	The investigation the coach reads	Your ProbeMatrix investigation, or the public sample (Section 9)
Python 3.9 or newer + openpyxl	Runs the helper program	Section 4 (often not needed for the Claude desktop app)
About 20 to 45 minutes	First-time setup	Later runs take a few minutes

Confidentiality. When you use the coach, the contents of your export are sent to the AI service you chose (Anthropic or OpenAI). Check your company's policy on sharing incident data with AI tools before using a real investigation. The ProbeMatrix export should already be de-identified to roles (no personal names). Every output is marked *Learning purposes: not a statutory document*.

How to read the instructions

- Text in **teal bold** is something you type or click exactly as shown.
- Grey boxes contain commands. Copy the whole line and paste it; you do not need to understand it.
- Where Windows and Mac differ, you get a separate **Windows** part and a separate **Mac** part. Follow only yours.

- Each section ends with a **Check it worked** box. Do not move on until the check passes; if it fails, see Section 12.

2. Which app should I use?

The coach works in four apps. You only need **one**. If you are unsure, choose **Path 1, the Claude desktop app (Cowork)**: it has buttons instead of typed commands and usually needs no Python setup.

	Path 1: Claude desktop (Cowork)	Path 2: Claude Code	Path 3: OpenAI Codex	Path 4: ChatGPT
Best for	Most users; non-technical	People comfortable typing commands	Teams already on OpenAI	Organisations on ChatGPT
How you work	Point and click, chat window	Text window (terminal)	Terminal or app	Point and click: Plugins directory and chat
Python on your computer?	Usually not needed	Yes	Yes	No (runs in ChatGPT)
Plan needed	Paid Claude plan	Claude Pro, Max, Team or Enterprise	ChatGPT plan with Codex	Workspace plan (an admin imports the marketplace once), or the ChatGPT desktop app
Setup effort	Easy (10 min)	Medium (30 min)	Medium (30 min)	Easy for users once an admin has imported it
Go to	Section 5	Sections 4 and 6	Sections 4 and 7	Section 8

Recommendation: start with Path 1. If your company does not allow the Claude desktop app, use Path 2 or 3. If your organisation runs on ChatGPT, Path 4 is the easy route: an admin imports the plugin marketplace once and everyone installs it with one click.

3. Basic computer skills used in this manual

You will need a few everyday skills. If you already know them, skip to Section 4.

3.1 Opening the command window

Some steps ask you to type a command into a text window. On Windows this window is called **PowerShell** (or **Terminal**); on a Mac it is called **Terminal**. It looks old-fashioned but it is safe: it only does what you type.

Windows

Step 1. Click the **Start** button (Windows logo, bottom-left or bottom-centre).

Step 2. Type **PowerShell**.

Step 3. Click **Windows PowerShell** (or **Terminal**). Do not choose "Run as administrator"; it is not needed.

Step 4. A window opens with a line such as **PS C:\Users\YourName>**. The **PS** at the start tells you that you are in PowerShell.

Mac

Step 1. Press **Command + Space** to open Spotlight search.

Step 2. Type **Terminal** and press **Return**.

Step 3. A window opens with a line ending in **%** or **$**. This is where you type.

3.2 Copying and pasting a command

- Select the command in this manual (or in the PDF) and copy it: **Ctrl + C** on Windows, **Command + C** on Mac.
- Click inside the PowerShell or Terminal window and paste: **Ctrl + V** (or right-click) on Windows, **Command + V** on Mac.
- Press **Enter** (Windows) or **Return** (Mac) to run it.
- Wait until you see the prompt line again (the line ending in >, % or $). Some commands show nothing for a minute while they download; that is normal.
- If copying from the PDF adds odd characters or breaks the line, type the command by hand instead.

3.3 Knowing whether a command worked

- Usually it worked if you see a version number, the words **Successfully installed**, or simply a fresh prompt line with no red text.
- It failed if you see **red text**, or words like **not recognized**, **not found**, **error** or **denied**. Look up the message in Section 12.

- After installing something new, **close the window and open a new one** before the next step. Many problems come from skipping this.

3.4 Making a working folder for your investigations

Keep each export in its own folder. The coach writes its results next to the export, so a dedicated folder keeps things tidy.

- **Windows:** open **File Explorer** > **Documents** > right-click an empty area > **New** > **Folder**, and name it **ProbeMatrix**.
- **Mac:** open **Finder** > **Documents** > **File** menu > **New Folder**, and name it **ProbeMatrix**.
- Move or save your .xlsx export into this folder.

3.5 Downloading this plugin as a ZIP file (only for the manual Codex option, Section 7.3)

Step 1. In your web browser go to **github.com/ashley-eyekyam/probematrix-learnings-coach**.

Step 2. Click the green **Code** button, then **Download ZIP**.

Step 3. Windows: open your **Downloads** folder, right-click **probematrix-learnings-coach-main.zip** > **Extract All** > **Extract**. **Mac:** double-click the ZIP in **Downloads**; a folder appears next to it.

Step 4. You now have a folder called **probematrix-learnings-coach-main** containing a **skills** folder.

4. Install Python and openpyxl

The coach's helper program needs **Python 3.9 or newer** and one extra Python package called **openpyxl**, which lets Python read and write Excel files.

Your path	Do you need this section?
Path 1: Claude desktop (Cowork)	Usually **no**. Cowork runs the helper in its own built-in workspace, which already has Python. Do this section only if Claude tells you Python or openpyxl is missing, or you also plan to use Path 2 or 3.
Path 2: Claude Code	**Yes**
Path 3: OpenAI Codex	**Yes**
Path 4: ChatGPT	**No**

4A. Windows: install Python

The simplest method is the free **Python Install Manager** from the Microsoft Store.

Step 1. Click **Start**, type **Microsoft Store** and open it.

Step 2. In the Store's search box type **Python Install Manager**. Choose the one published by the **Python Software Foundation**.

Step 3. Click **Get** or **Install** and wait for it to finish.

Step 4. Open a **new** PowerShell window (Section 3.1).

Step 5. Type **python** and press Enter. The first time, the Install Manager downloads the latest Python for you. If it asks whether to **add a folder to your PATH** or to configure anything, answer **y** (yes) and press Enter.

Step 6. When you see **>>>**, Python is running. Type **exit()** and press Enter to leave it.

Step 7. Close PowerShell and open a new one.

Check the version (type each line, press Enter)

```
python --version
python3 --version
```

Check it worked: both lines print something like **Python 3.14.x** (any version 3.9 or higher is fine). If Windows opens the Microsoft Store or says **Python was not found**, see Section 12, problem W1.

Alternative (if your company blocks the Microsoft Store): go to **python.org/downloads** and download the Windows installer. On the first installer screen **tick "Add python.exe to PATH"** before clicking **Install Now**. This route gives you the commands **python** and **py** but not always **python3**; see Section 12, problem W2.

4B. Windows: install openpyxl

In a PowerShell window, copy and paste this line and press Enter:

```
python -m pip install --user openpyxl
```

You should see **Successfully installed openpyxl** (and "et_xmlfile"). If it says **Requirement already satisfied**, it was already there, which is fine.

Check openpyxl

```
python -c "import openpyxl; print(openpyxl.__version__)"
```

Check it worked: a version number such as **3.1.5** appears. If you see **ModuleNotFoundError**, see Section 12, problem P1.

4C. Mac: install Python

Macs do not include a modern Python ready to use. Install the official one from python.org.

Step 1. In Safari or Chrome go to **python.org/downloads**.

Step 2. Click the yellow button **Download Python 3.x.x** (the site detects that you are on a Mac).

Step 3. Open your **Downloads** folder and double-click the file ending in **.pkg**.

Step 4. Click **Continue** on each screen, **Agree** to the licence, then **Install**. Enter your Mac login password when asked.

Step 5. When it finishes, a Finder window opens. Double-click **Install Certificates.command**. A Terminal window runs briefly; close it when it says done. (This lets Python download packages securely.)

Step 6. Click **Close** on the installer. You can move the installer to the Bin.

Step 7. Open a **new** Terminal window (Section 3.1).

Check the version

```
python3 --version
```

Check it worked: it prints **Python 3.x.x** with x of 9 or higher. If a pop-up asks you to install "command line developer tools", click **Install**, wait, then try again; that also provides a usable Python.

4D. Mac: install openpyxl

```
python3 -m pip install --user openpyxl
```

You should see **Successfully installed openpyxl**. If you see **externally-managed-environment**, see Section 12, problem M2.

Check openpyxl

```
python3 -c "import openpyxl; print(openpyxl.__version__)"
```

Check it worked: a version number such as **3.1.5** appears.

5. Path 1: Claude desktop app (Cowork)

Cowork is the part of the Claude desktop app that can work on files on your computer. You install the plugin once through menus; it is then saved to your Claude account and is also available in Claude chat and Claude Code.

5.1 Install the Claude desktop app

Windows

Step 1. Go to **claude.com/download** and click the **Windows** download.

Step 2. Open the downloaded file from your **Downloads** folder and follow the installer.

Step 3. Open **Claude** from the Start menu and sign in with your Claude account.

Mac

Step 1. Go to **claude.com/download** and click the **macOS** download.

Step 2. Open the downloaded **.dmg** file and drag the **Claude** icon into the **Applications** folder.

Step 3. Open **Claude** from Applications (or Spotlight). If macOS asks "Are you sure you want to open it?", click **Open**. Sign in.

5.2 Add the ProbeMatrix plugin (same on Windows and Mac)

Step 1. In the Claude app's left sidebar click **Customize**, then **Plugins**.

Step 2. Click **Add marketplace**.

Step 3. Type or paste **ashley-eyekyam/probematrix-learnings-coach** and confirm. (The full address https://github.com/ashley-eyekyam/probematrix-learnings-coach also works.)

Step 4. Find **ProbeMatrix Learnings Coach** in the list (use **Discover** or search for **probematrix**).

Step 5. Click **Install**.

Step 6. Open the installed plugin. Its **Skills** tab should list 23 skills, starting with **learnings-coach**.

Step 7. Optional: on the marketplace, turn on **Sync automatically** so you receive updates.

Check it worked: the plugin shows as installed and its Skills tab lists **learnings-coach**, **board-brief**, **supervisor-coach** and the others.

On a company (Team or Enterprise) account? Your administrator may need to allow custom marketplaces, or may add the plugin for everyone from organisation settings. If **Add marketplace** is missing or greyed out, send this page to your Claude administrator.

5.3 Use it in Cowork

Step 1. Put your export in its own folder (Section 3.4).

Step 2. In the Claude app open **Cowork** and start a new task.

Step 3. Give Cowork access to that folder (choose or connect the folder when prompted), or attach the .xlsx file to the message.

Step 4. Type a request such as: **Use the ProbeMatrix learnings coach on this export and give me the supervisor coach.**

Step 5. Claude sets up the workspace, tells you in two or three lines what the investigation contains, and then writes the outputs. It may ask your permission before running the helper; click **Allow**.

Step 6. When it finishes, Claude tells you where the files are. Continue with Section 10.

If Claude says **openpyxl** is missing, reply: *"Please install openpyxl and continue."* If it still cannot, do Section 4 on your computer.

6. Path 2: Claude Code

Claude Code is Claude in a text window. Complete **Section 4** (Python and openpyxl) first.

6A. Windows

Step A1: Install Git for Windows (recommended)

Step 1. Go to **git-scm.com/downloads/win** and download the 64-bit installer.

Step 2. Run it and click **Next** on every screen, keeping the default choices, then **Install** and **Finish**.

Claude Code works without Git, but with it Claude can use extra tools reliably.

Step A2: Install Claude Code

Open PowerShell (Section 3.1) and paste:

```
irm https://claude.ai/install.ps1 | iex
```

Nothing may appear for a minute while it downloads. When the prompt returns, **close PowerShell and open a new one**, then type:

```
claude --version
```

Check it worked: a version number appears, such as **2.1.x (Claude Code)**. If you see **'claude' is not recognized**, see Section 12, problem C1.

6B. Mac

Open Terminal (Section 3.1) and paste:

```
curl -fsSL https://claude.ai/install.sh | bash
```

When it finishes, **close Terminal and open a new one**, then type:

```
claude --version
```

Check it worked: a version number appears. If you see **command not found: claude**, see Section 12, problem C1.

6C. Sign in and add the plugin (Windows and Mac)

Step 1. Go to your ProbeMatrix folder in the command window. Easiest way: type **cd** followed by a space, then drag the ProbeMatrix folder from File Explorer or Finder into the window, and press Enter.

Step 2. Type **claude** and press Enter.

Step 3. The first time, Claude Code opens your web browser to sign in. Sign in with your Claude account and return to the window. If asked whether you trust this folder, choose **Yes**.

Step 4. You now see a box where you can type to Claude. Type each of these lines, pressing Enter after each one and waiting for it to finish:

```
/plugin marketplace add ashley-eyekyam/probematrix-learnings-coach
/plugin install probematrix-learnings-coach@probematrix
/reload-plugins
```

Step 5. Type **/plugin** and press Enter to see your plugins. Check that **probematrix-learnings-coach** is listed and enabled. Press **Esc** to close the list.

Check it worked: the plugin is listed; its skills appear with names such as **probematrix-learnings-coach:learnings-coach**.

6D. Use it

Step 1. Make sure your export is in the folder you opened.

Step 2. Type a request, for example: **Use the learnings coach on MyExport.xlsx and give me the supervisor coach.** (Replace MyExport.xlsx with your file name.)

Step 3. Claude asks before running commands. Read the request and choose **Yes** to allow it. You can choose the option to allow similar commands for the session to avoid repeated questions.

Step 4. To finish, type **/exit** or close the window.

Next time: open a command window, go to your folder (cd + drag), type **claude**. The plugin is already installed.

7. Path 3: OpenAI Codex

Codex can install the coach directly from its plugin marketplace on GitHub, the same way Claude does. You will (1) install Codex, (2) add the marketplace and install the plugin, (3) use it. Complete **Section 4** (Python and openpyxl) first.

7.1 Install Codex

Codex comes as a desktop app and as a command-line tool. If your organisation already gives you the Codex or ChatGPT desktop app with Codex, use that and skip to 7.2. Otherwise install the command-line tool as below.

Windows

Step 1. Install **Node.js**: go to **nodejs.org**, download the **LTS** Windows installer, run it and accept the defaults.

Step 2. Close and reopen PowerShell, then paste:

```
npm install -g @openai/codex
codex --version
```

Mac

Step 1. Install **Node.js**: go to **nodejs.org**, download the **LTS** macOS installer (.pkg), open it and click through.

Step 2. Close and reopen Terminal, then paste:

```
npm install -g @openai/codex
codex --version
```

If the Mac shows **EACCES: permission denied**, run the first line again with **sudo** in front (sudo npm install -g @openai/codex) and type your Mac password. Nothing appears while you type the password; that is normal.

Check it worked: codex --version prints a version number. Then type **codex**, press Enter, choose **Sign in with ChatGPT** and finish signing in in your browser.

7.2 Add the marketplace and install the plugin (recommended)

Open PowerShell (Windows) or Terminal (Mac) and paste these lines one at a time. The commands are the same on both.

```
codex plugin marketplace add ashley-eyekyam/probematrix-learnings-coach
codex plugin marketplace list
codex plugin list
codex plugin add probematrix-learnings-coach
```

- Line 1 tells Codex where the marketplace lives on GitHub. Codex reads the plugin's marketplace file directly.
- Line 2 should now list a marketplace called **probematrix**.
- Line 3 lists the plugins available to you; look for **probematrix-learnings-coach**.
- Line 4 installs it. If Codex says the name is not found, copy the exact plugin name shown by line 3 and use that.

Using the Codex or ChatGPT desktop app instead? After line 1, restart the app, open the **Plugins** directory, choose the **probematrix** marketplace and click **Install plugin** on ProbeMatrix Learnings Coach.

Check it worked: codex plugin list shows probematrix-learnings-coach as installed.

7.3 Manual option: copy the skills (only if 7.2 is blocked)

Use this only if your company blocks plugin marketplaces. Download and extract the plugin ZIP (Section 3.5), then:

- **Windows (PowerShell):** cd into the extracted folder, then run **New-Item -ItemType Directory -Force "$HOME\.agents\skills"** and **Copy-Item -Recurse -Force .\skills* "$HOME\.agents\skills\"**
- **Mac (Terminal): cd ~/Downloads/probematrix-learnings-coach-main**, then **mkdir -p ~/.agents/skills** and **cp -R skills/* ~/.agents/skills/**
- Keep **learnings-coach** with the others: every skill uses its helper program.

7.4 Use it

Step 1. Restart Codex (close it fully and reopen) so it loads the plugin.

Step 2. Open your ProbeMatrix folder: in the app, open the folder; in the command window, cd to the folder (cd + drag) and type **codex**.

Step 3. Type **/skills** to confirm **learnings-coach** is listed.

Step 4. Ask, for example: **Use $learnings-coach on ./MyExport.xlsx and make toolbox-talk learning cards.**

Step 5. Approve the commands Codex asks to run.

8. Path 4: ChatGPT

ChatGPT can import a **plugin marketplace** straight from a GitHub repository. The coach's repository already contains the marketplace file ChatGPT looks for (**.claude-plugin/marketplace.json**, which ChatGPT accepts as a Claude-compatible marketplace), so nothing has to be repackaged, zipped or uploaded by hand. There are two parts: an **admin imports** the marketplace once for the workspace, then **each user installs** the plugin with one click. Windows and Mac are the same, because everything happens in ChatGPT.

Who does what: in a ChatGPT Business, Enterprise or Edu workspace, only a **workspace admin** can import a marketplace. If you are not an admin, send Section 8.1 to your ChatGPT administrator and go straight to Section 8.2 once they confirm. On a personal plan without an admin, use Section 8.3.

8.1 For the workspace admin: import the marketplace (once)

Step 1. Open the ChatGPT **Admin Console** and select the workspace that should get the plugin.

Step 2. Open **Plugins**, choose **Add**, then **Import marketplace**.

Step 3. In **Source**, paste the repository root address only: **https://github.com/ashley-eyekyam/probematrix-learnings-coach** (no branch or folder at the end).

Step 4. Leave **Path** empty (the marketplace file is at the root of the repository). Leave **Branch, tag, or commit** empty to follow the latest version, or enter a release tag to freeze a version.

Step 5. Select **Import marketplace** and authorise GitHub when asked. The repository is public, so any GitHub account can read it; your company's GitHub organisation may need to approve the ChatGPT app.

Step 6. Review the **Import results**. **ProbeMatrix Learnings Coach** should appear as an imported plugin.

Step 7. Set its **Installation policy** for each role: **Available** (people install it themselves) or **Installed** (everyone gets it automatically). New plugins start as Available.

Check it worked: the marketplace appears under Plugins > Marketplaces. ChatGPT syncs it daily; to pull an update immediately, open the marketplace and choose **Sync now**.

8.2 For every user: install the plugin

Step 1. Open ChatGPT (web at chatgpt.com, the Windows or Mac desktop app, or mobile) and select **Plugins** in the sidebar, or go to **chatgpt.com/plugins**.

Step 2. Open the **Your workspace** view and select **ProbeMatrix Learnings Coach**. (If your admin set it to Installed, it is already in the **Installed** view; skip to 8.4.)

Step 3. Review the plugin's page: it lists the 23 skills. The coach needs no app connections or accounts.

Step 4. Select **Install plugin**.

Check it worked: the plugin shows in the **Installed** view.

8.3 No workspace admin? Use the ChatGPT desktop app

Individual users can make a GitHub marketplace visible to the ChatGPT desktop app through the Codex command-line tool:

Step 1. Install the ChatGPT desktop app for Windows or Mac from chatgpt.com/download and sign in.

Step 2. Install the Codex command-line tool (Section 7.1).

Step 3. In PowerShell or Terminal run: **codex plugin marketplace add ashley-eyekyam/probematrix-learnings-coach**

Step 4. Quit and reopen the ChatGPT desktop app, open **Plugins**, choose the **probematrix** marketplace and select **Install plugin**.

8.4 Use it

Step 1. Start a new chat and attach your .xlsx export.

Step 2. Type @ and choose **ProbeMatrix Learnings Coach** (or select **+** or **Plugins** in the message box), then ask, for example: **Use the learnings coach on this export and build the learnings register.**

Step 3. Installed plugins are also used automatically when your request matches them, so a plain request usually works.

Step 4. Download the files ChatGPT produces from the links in its reply. The HTML packs and dashboard open offline in your browser.

About Python: the coach's helper program runs inside ChatGPT's own code environment, so you install nothing on your computer. If ChatGPT replies that it cannot run the helper (pmlc.py) or cannot install openpyxl, your workspace may have code execution turned off; ask your admin, or use Path 1, 2 or 3.

9. Your first run, step by step

9.1 Get an export to practise on

Use your own ProbeMatrix export, or the free public sample in the plugin's **samples** folder:

Step 1. Go to **github.com/ashley-eyekyam/probematrix-learnings-coach/tree/main/samples**.

Step 2. Open the folder **SAMPLE-FOLDER**.

Step 3. Click the file ending in _**probematrix-findings.xlsx**, then click the **Download** button (down-arrow icon, top right of the file view).

Step 4. Move the downloaded file into your ProbeMatrix folder (Section 3.4).

The sample is based on a public-record incident and is de-identified to roles. A ProbeMatrix export contains five sheets the coach reads: Incident Summary, Identified Findings, Evidence Links, Causal Chain and Analysis Statistics. Do not rename or delete sheets.

9.2 Ask for an overview first

A good first request is the whole-organisation view. Type into your app:

> *"Here's a ProbeMatrix export. Use the learnings coach, tell me what the investigation contains, then build the learnings register and the organisation learning dashboard."*

What happens next:

- **Setup.** The coach reads the export and creates a run folder named after the incident date, site and event.
- **Profile.** It tells you in two or three lines how many findings there are, how many sit at the supervision and organisational levels, how many evidence items there are, and any data-quality flags (for example a date on the summary sheet that disagrees with the narrative). It states any correction it makes; it never silently changes your data.
- **Classification.** It places each finding with the department (for example maintenance, operations, emergency response) and level (frontline to board) that owns the learning. If some roles cannot be placed automatically, it may say so and resolve them.
- **Outputs.** It writes the files and tells you where they are.

9.3 Then ask for audience packs

Ask for one audience at a time. Examples you can copy:

- "What should our supervisors learn from it?"
- "Make toolbox-talk learning cards for the maintenance crews."
- "Prepare a board briefing with the questions directors should ask."

- "Compare this with the official enquiry report (attached)."
- "Give me everything the fire services need to learn."

Tip: if your request is broad ("everyone"), the coach may ask one question: which audience first? Answer with the group you need soonest.

10. Where your files go and how to open them

Every run gets one folder **next to your export**, inside a folder called **pmlc-runs**. The run folder is named **date-site-event**, for example **2020-09-24-hazira-gas-release-fire**.

```
ProbeMatrix/ (your folder)
  MyExport.xlsx (your export)
  pmlc-runs/
    2020-09-24-site-event/
      workspace/ working files - you can ignore these
      outputs/ YOUR RESULTS ARE HERE
        organisation-learning-map.html
        learnings-register.xlsx .md .json
        supervisor-coach.html .md
        board-brief.html .md ... one pair per pack
```

File type	What it is	How to open it
.html	The main, interactive version of each pack and the dashboard. Collapsible sections, search, print, and every Finding and Evidence ID can be clicked to show the full record. Works offline.	Double-click; it opens in your web browser (Chrome, Edge, Safari).
.xlsx	The Learnings Register as a formatted Excel workbook.	Double-click to open in Excel or Numbers.
.md	The same content as plain text (Markdown), handy to paste into Word or email.	Right-click > Open with > Notepad (Windows) or TextEdit (Mac).
.json	Data files the coach uses to build the HTML. Leave them in place.	Not needed.

Using the dashboard

- **organisation-learning-map.html** shows who in the organisation must learn what: a heat map of departments against levels, how strong the recommended fixes are, and an order for rolling out audience packs.
- When a Learnings Register exists, the dashboard has two tabs: **Overview** and **Detailed register** (every learning, recommendation, finding and evidence quote, with views for frontline, supervisors, managers, site leaders, board, investigators and auditors).
- To share, send the .html file itself; it is self-contained. To print or save as PDF, use your browser's **Print** command.

Principles built into every output: learning, not blame; roles, never names; every sentence traces back to Finding and Evidence IDs; and each document is marked *Learning purposes: not a statutory document*. Review outputs before sharing them, as you would any draft.

11. Skill-by-skill guide (all 23 skills)

You do not need to name a skill: describe what you want and the coach picks the right one. The table shows who each skill serves, a request you can copy, and what it produces. Unless noted, each skill writes **[skill-name].html** (open this first) and **[skill-name].md** in the outputs folder.

11.1 Start here and whole-organisation views

Skill	For	Example request	Produces
learnings-coach	Everyone. Start here.	"Use the learnings coach on this export."	Sets up the run, a profile of the investigation, and routes to the right skill
learning-clusters	Analysts	"Group the findings by department and level."	Every finding classified by department, level and role relation
organisation-learning-map	Leadership, HSE	"Show me who needs to learn what."	organisation-learning-map.html dashboard and a rollout plan
learnings-register	HSE, management	"Build a lessons-learned register in Excel."	learnings-register .xlsx, .md and .json
cluster-learning-dossier	Any one department	"What does maintenance need to learn?"	dossier-[department].html: every learning for one function

11.2 Analysis skills

Skill	For	Example request	Produces
causal-map	Investigators, leaders	"How do the factors connect? Draw the causal chain."	Causal diagram, ranked pathways, plain-language story
precursor-timeline	Leaders, auditors	"Did we see this coming? What warnings were missed?"	Dated timeline of weak signals and who received them
interface-learnings	Managers	"What fell between departments?"	Handover and shared-ownership gaps
barrier-learnings	Engineers, HSE	"Which barriers failed and how strong should the fixes be?"	Barrier failures, owners, hierarchy-of-controls fixes, indicators
report-comparison	HSE, consultants	"Compare this with the official report (attached)."	Fair two-way comparison. Attach the other report as PDF, Word or text.
investigator-coach	Investigators	"What evidence is missing and who else should we interview?"	Evidence gaps, key questions, interviews, plus follow-up.json

11.3 Audience skills

Skill	For	Example request	Produces
frontline-learning-cards	Operators, technicians, crews	"Make toolbox talks for the shift crews."	5-8 Learning Cards, 2-3 five-minute toolbox talks, a "stop and ask" list
supervisor-coach	Shift in-charges, permit issuers	"What should supervisors check?"	Before-work checklist, return-to-service hold points, what to escalate or refuse
manager-coach	Department managers	"Give managers a 90-day agenda."	System learnings, leading indicators, 30/60/90-day agenda
site-leadership-coach	Plant manager, site leadership	"What does the plant manager need to decide?"	Decisions, trade-offs, culture signals, workshop
top-management-brief	CEO, ExCo, corporate HSE	"Write an ExCo brief on cross-site lessons."	Enterprise lessons, policy and investment decisions
board-brief	Board, board safety committee	"Prepare a board paper with questions for directors."	Governance lessons, 8-12 board questions, assurance evidence
auditor-assurance-pack	Auditors, insurers, inspectors	"Give me an audit checklist to test other sites."	Audit test points, sampling, evidence requests, red flags
training-designer	L&D, instructors	"Design a training module with a quiz."	Training-needs map, modules, scenarios, 10-15 questions with answers
emergency-response-learnings	Fire services, ERT, incident command	"What should the fire service learn?"	Response timeline, emergency-plan gaps, drill scenarios
engineering-integrity-learnings	Engineering, integrity, MOC, I&C	"Technical lessons for the integrity team."	Technical learnings and decisions
supply-chain-contractor-learnings	Procurement, stores, vendors, contractors	"What should procurement and contractors learn?"	Sourcing, spares and contractor-control learnings
safety-committee-guide	Safety committees, workforce reps	"A discussion guide for our safety committee."	Plain-language account, questions to raise, 30/60/90-day follow-up

Need it as Word, PowerPoint or Excel? After a pack is made, ask: *"Turn the board brief into a Word document"* or *"Put the audit test points in an Excel sheet."* Your AI app can convert the content.

12. Troubleshooting

Find the message you see in the left column. Codes start with **W** for Windows, **M** for Mac, **P** for Python on both, **C** for Claude Code, **X** for Codex, **H** for ChatGPT and **G** for general.

12.1 Windows

Code	What you see	Fix
W1	Typing python opens the Microsoft Store, or "Python was not found; run without arguments to install from the Microsoft Store"	Python is not installed yet, or Windows' shortcut is getting in the way. Install Python (Section 4A). If it continues: Start > type **Manage app execution aliases** > turn **off** "App Installer python.exe" and "python3.exe". Open a new PowerShell.
W2	python works but python3 is "not recognized"	Common with the python.org installer. Either install the Python Install Manager (Section 4A), or tell your AI app once: *"On this computer use python instead of python3."*
W3	"running scripts is disabled on this system"	Paste: **Set-ExecutionPolicy -Scope CurrentUser RemoteSigned**, answer **Y**, then try again. Ask IT if your company manages this setting.
W4	Codex skills do not appear; .agents\skills shows as a file, not a folder	Delete that file and repeat Section 7.3, or use the marketplace install in Section 7.2.
W5	"Access is denied" while installing	Do not use "Run as administrator". If your company locks installs, ask IT to install Python, Git, Node.js or Claude for you.

12.2 Mac

Code	What you see	Fix
M1	"zsh: command not found: python3"	Install Python (Section 4C), then open a new Terminal window.
M2	"error: externally-managed-environment" when installing openpyxl	Your Python came from Homebrew. Use: **python3 -m pip install --user --break-system-packages openpyxl**, or install Python from python.org (Section 4C).
M3	"SSL: CERTIFICATE_VERIFY_FAILED"	Open Finder > Applications > Python 3.x > double-click **Install Certificates.command**. Try again.
M4	"Claude/Codex can't be opened because the developer cannot be verified"	Open **System Settings** > **Privacy and Security**, scroll down and click **Open Anyway**.
M5	"EACCES: permission denied" with npm	Put **sudo** before the command and type your Mac password (Section 7.1).

12.3 Python and openpyxl (both)

Code	What you see	Fix
P1	"ModuleNotFoundError: No module named 'openpyxl'"	openpyxl is installed for a different Python than the one the AI uses. Ask the AI: *"Install openpyxl for the Python you are using and continue."* Or repeat Section 4B/4D in a new window.
P2	"No module named pip"	Windows: **python -m ensurepip --upgrade**. Mac: **python3 -m ensurepip --upgrade**. Then repeat the openpyxl step.
P3	Python version lower than 3.9	Install a current Python (Section 4).

12.4 Claude Code and Codex

Code	What you see	Fix
C1	'claude' is not recognized (Windows) or command not found: claude (Mac)	First close and reopen the window. Still failing? **Windows:** Start > type **Edit environment variables for your account** > select **Path** > **Edit** > **New** > paste **%USERPROFILE%\.local\bin** > OK > reopen PowerShell. **Mac:** paste **echo 'export PATH="$HOME/.local/bin:$PATH"' >> ~/.zshrc**, then open a new Terminal.
C2	"'irm' is not recognized" or "The token '&&' is not a valid statement separator"	You are in the wrong kind of window. Use PowerShell for the irm command (Section 3.1).
C3	Plugin not found after /plugin install	Check the marketplace line was typed exactly, run **/plugin marketplace update probematrix**, then install again and **/reload-plugins**.
C4	Claude Code says your plan does not include it	Claude Code needs Pro, Max, Team or Enterprise. Use Path 1 or upgrade.
X1	Codex does not list the skills	Run **codex plugin list** to check the plugin is installed (Section 7.2), then restart Codex completely.
X2	"codex plugin" is not a known command	Your Codex is out of date. Run **npm install -g @openai/codex@latest**, then try again.

12.5 ChatGPT

Code	What you see	Fix
H1	ProbeMatrix Learnings Coach is not in the Plugins directory	An admin has not imported the marketplace yet (Section 8.1), or your role is not given access. Ask your admin to check the Installation policy, or open the marketplace and choose **Sync now**.
H2	Import marketplace fails or finds no plugins	Source must be the repository root URL only, with Path left empty. The GitHub organisation may need to approve the ChatGPT app.
H3	No Import marketplace option in the Admin Console	Only workspace admins see it. Personal plans: use Section 8.3.
H4	ChatGPT says it cannot run the helper program	Code execution may be off for your workspace. Ask your admin, or use Path 1, 2 or 3.

12.6 General

Code	What you see	Fix
G1	The coach cannot read the export, or says sheets are missing	Use the original ProbeMatrix export. Do not rename sheets, and close the file in Excel before running.
G2	"Some roles are not yet placed"	Normal for a quick first answer. Ask: *"Resolve the unresolved roles, then redo the pack."*
G3	I cannot find the outputs	Look next to the export: pmlc-runs > [date-site-event] > outputs. Or ask the AI: *"Where did you save the files?"*
G4	The date or incident type in the output differs from the summary sheet	The coach found the summary sheet disagrees with the narrative and states the correction. Check it; tell the AI if the original was right.
G5	The .html file opens as code	Right-click > Open with > your web browser.

Still stuck? Copy the exact error message into your AI app and ask, *"What does this mean and how do I fix it?"* You can also report issues on GitHub (github.com/ashley-eyekyam/probematrix-learnings-coach/issues) or email ashley@eyekyam.com.

13. Updating and removing the plugin

App	Update	Remove
Claude desktop (Cowork)	Customize > Plugins > the probematrix marketplace > **Check for updates** (or turn on Sync automatically)	Customize > Plugins > open the plugin > **Remove**
Claude Code	/plugin marketplace update probematrix, then /reload-plugins	/plugin uninstall probematrix-learnings-coach@probematrix
OpenAI Codex	codex plugin marketplace upgrade probematrix, then restart Codex (manual option: download the ZIP again and repeat 7.3)	codex plugin remove probematrix-learnings-coach (manual option: delete the 23 skill folders from .agents/skills)
ChatGPT	Automatic daily sync; an admin can choose Sync now on the marketplace	Users: Plugins > Installed > the plugin > uninstall. Admins: remove the marketplace (this removes its plugins for everyone)

Python and openpyxl can stay installed; other software may use them. To update openpyxl: Windows **python -m pip install --user --upgrade openpyxl**; Mac **python3 -m pip install --user --upgrade openpyxl**.

14. Quick reference card

Task	Windows (PowerShell)	Mac (Terminal)
Check Python	python --version	python3 --version
Install openpyxl	python -m pip install --user openpyxl	python3 -m pip install --user openpyxl
Check openpyxl	python -c "import openpyxl"	python3 -c "import openpyxl"
Install Claude Code	irm https://claude.ai/install.ps1 | iex	curl -fsSL https://claude.ai/install.sh | bash
Start Claude Code	claude	claude
Install Codex CLI	npm install -g @openai/codex	npm install -g @openai/codex
Add plugin in Codex	codex plugin marketplace add ashley-eyekyam/probematrix-learnings-coach then codex plugin add probematrix-learnings-coach	same as Windows
Go to a folder	cd + space, then drag the folder in	cd + space, then drag the folder in

Inside Claude Code

```
/plugin marketplace add ashley-eyekyam/probematrix-learnings-coach
/plugin install probematrix-learnings-coach@probematrix
/reload-plugins
/plugin
```

Inside Cowork

Customize > Plugins > Add marketplace > **ashley-eyekyam/probematrix-learnings-coach** > Install.

Inside ChatGPT

Admin, once: Admin Console > Plugins > Add > Import marketplace > **https://github.com/ashley-eyekyam/probematrix-learnings-coach**. Everyone: Plugins > Your workspace > ProbeMatrix Learnings Coach > Install plugin.

Five requests to try

- "Use the learnings coach on this export and tell me what it contains."
- "Build the learnings register and the organisation learning dashboard."
- "What should our supervisors learn from it?"
- "Make toolbox-talk learning cards for the maintenance crews."
- "Prepare a board briefing with the questions directors should ask."

Want a ProbeMatrix investigation of your own incident, or a second look at a closed one? Email ashley@eyekyam.com. The Learnings Coach is free and open source under the MIT licence.
